

Travelling waves in the plane of lattices

All pole-compatible (n, p) with $2 \leq p \leq 6$ and $2 \leq n \leq 7$

All 30 low-order pairs

$n \setminus p$	2	3	4	5	6
2	2	3	4	5	6
3	1	—	2	—	3
4	—	1	—	—	2
5	—	—	1	—	—
6	—	—	—	1	—
7	—	—	—	—	1

Numbers are pole orders $q = p/(n - 1)$.
Dashes: no integral pole balance.

Reading the plane

$$\Delta = g_2^3 - 27g_3^2$$

Grey cusp: degenerate lattice
Pale interior: $\Delta > 0$
Off the cusp: elliptic lattice
Origin: rational degeneration

Colors follow the parameter within each declared coefficient slice.

13 pairs · 19 slices

The full book contains every plate, companion slices, and enlarged details.

[Open index.html](#) for the slider gallery.

Counts are modulo translation and phase.
A real lattice need not give a smooth, bounded real-valued wave.

At $p = 2$ the conservative equation can carry a continuum of waves.
