

Swift-Hohenberg · two lattice curves

$$u'''' + au'' + u - 120u^3 = 0$$

$$(n, p) = (3, 4) \cdot q = 2$$

Grey cusp: $\Delta = 0$
Pale region: $\Delta > 0$
Diamonds: real degeneration parameters

Both character branches are shown, up to translation and sign.
They coincide at $a = \pm 5/2$ on the cusp.
Lattice of the full twisted period group Γ · Real invariants do not alone imply a bounded real profile.
