

Swift-Hohenberg · the dispersive curve

$(n, p) = (3, 4) \cdot q = 2$

$u'''' + u''' + au'' + a_1(a)u' + a_0(a)u - 120u^3 = 0$

Grey cusp: $\Delta = 0$
Pale region: $\Delta > 0$
Diamonds: real degeneration parameters

The residue condition fixes $a_1 = (196a - 39)/1372$, then a_0 and the lattice are fixed.
One wave per equation, with a character of order two.
Lattice of the full twisted period group Γ · Real invariants do not alone imply a bounded real profile.
